

Web and mobile session management

The shortcut to mainframe modernization

UniGW® Session Manager is the world's most technologically advanced session management solution and a powerful tool for modernizing access to your mainframe applications.

Instantly web enable your mainframe applications

Organizations facing the daunting prospect of developing new web interfaces for their mainframe applications can use UniGW® Session Manager as a quick and cost-effective alternative. The UniGW® Session Manager browser interface provides instant web and mobile access to your mainframe applications, without any development costs or effort.

Stop using terminal emulation software and reduce your license charges

The UniGW® Session Manager browser interface increases convenience and productivity for users because they are no longer tied to a computer running a terminal emulator. Now you can interact with your mainframe applications using any device that has a browser. At the same time, you can achieve significant cost savings because you no longer need to pay for terminal emulation software to access the mainframe.

Key features of UniGW® Session Manager for web and mobile users

- **Effortless web enablement** – all your existing mainframe 3270, IBM i 5250 and Unix VT200 screens are automatically transformed into web interfaces: no programming changes are required
- **Optimization for touchscreen and mouse** – function keys are replaced with on-screen buttons to allow navigation by pointing and clicking or using a touchscreen
- **Secure web access** – unlike web interfaces built from scratch, UniGW® Session Manager has in-built security for controlling user access to individual applications, features and commands, and integrates with external security products such as RACF
- **Enhanced usability** – the browser interface provides an enhanced main menu, operator and helpdesk interface, which include many extra features to increase productivity and ease of use, such as drop-down menus and advanced search capabilities
- **Performance monitoring** – an integrated performance dashboard, UniGW® Analyzer, helps you to improve service levels by monitoring key metrics such as response times and user activity. You can also view historical trends, perform data extrapolation, compare multiple time slices, set warning thresholds, and trigger exception notifications

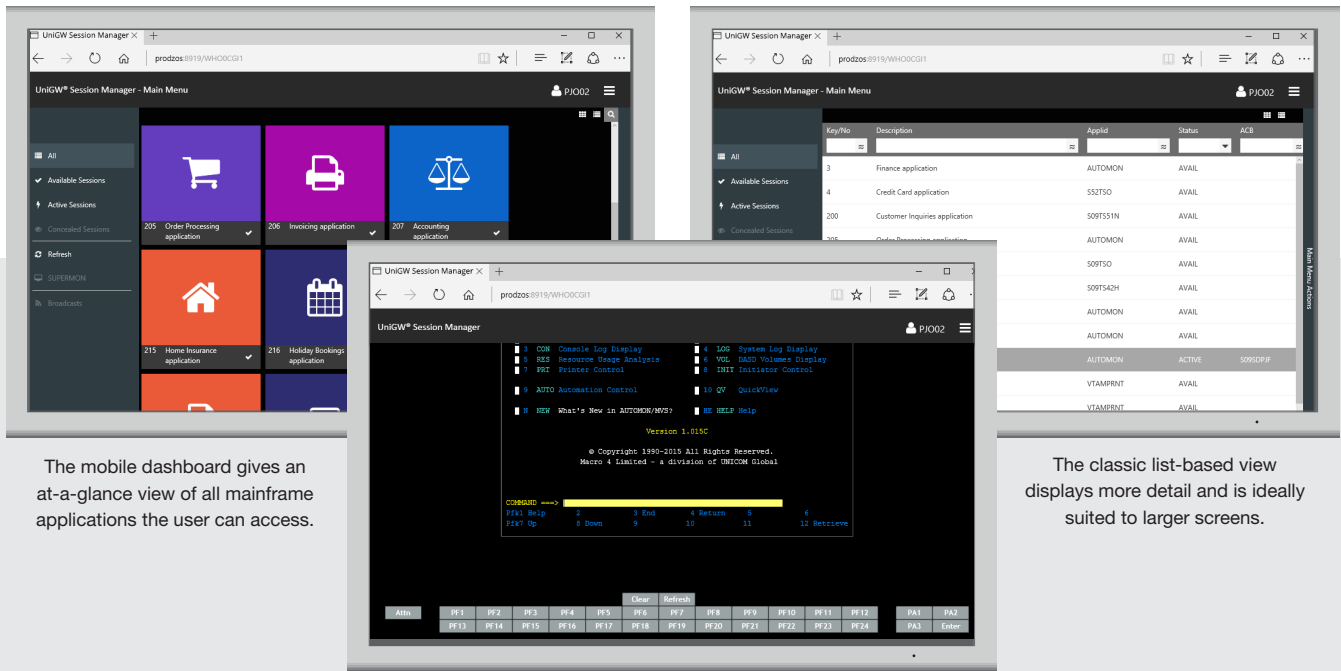

Create a brand new screen layout quickly and painlessly

To create a completely new web interface within hours simply choose the option to customize your screen layouts. You can easily update the appearance of screens, hide an application's mainframe origins by removing the command line, and add new features such as pop-up menus and calendars.

UniGW® Session
Manager provides
instant browser
access to applications
running on IBM
mainframe systems
and beyond

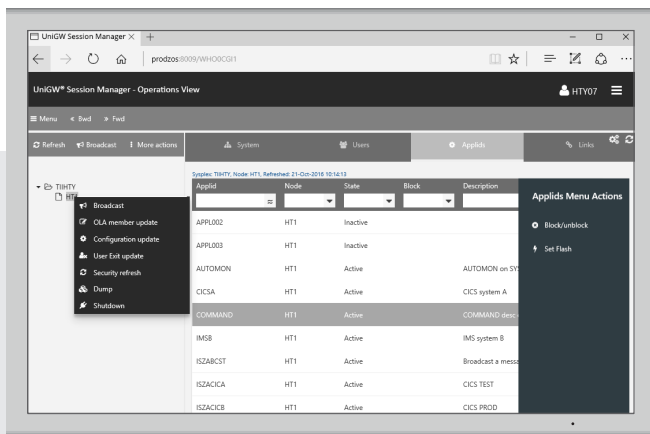

Accessing a mainframe application from the UniGW® Session Manager browser interface

The user has a choice of two menus:

The user's chosen application is instantly web enabled, with full mouse and touchscreen control.

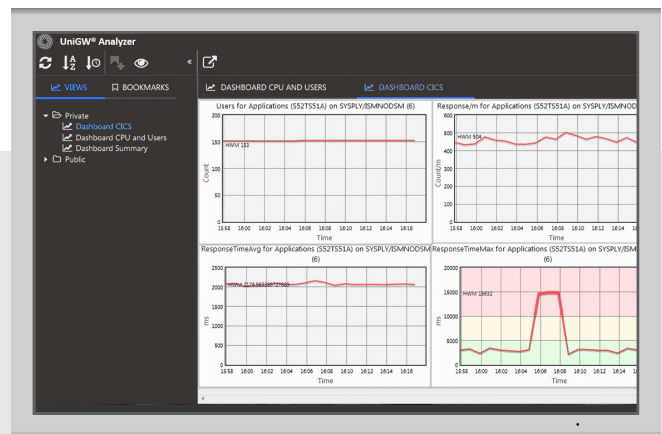

The operator and helpdesk interface

Tabs and drop-downs improve ease of use and reduce the need for training.

The same approach can be adopted to customize the appearance of any mainframe application.

Integrated performance monitoring

Real-time, historical and trend data can be viewed and analyzed.

More about UniGW® Session Manager

UniGW® Session Manager is a leading session management solution that provides secure, flexible, user-friendly and responsive access to applications running on, or accessible from IBM mainframe systems. From a single signon, UniGW® Session Manager delivers concurrent multi-session application support.

Users can switch easily between sessions, with no loss of context, leading to greater efficiency and productivity. The software includes a comprehensive suite of features, including a range of user interfaces (web, mobile, 3270 and Eclipse); online and batch administration capabilities; application performance monitoring; and powerful helpdesk facilities.
